**PROJECT
EVALUATOR**

**PROJECT
GUIDE**

ACKNOWLEDGEMENT

It is my great pleasure to present my project on ("**Airline Reservation System**") which I got in the 5th semester of BCA as a subject

First of all I would thanks **BKNMU(Bhakta Kavi Narsinh Mehta University)** to give the opportunity to implements my practical knowledge in a project as a subject.I would also thanks to my collage **SSSDIIT-Junagadh(Shastri Swami Shree Dharmajivandasji Institute Of Information Technology)** to provide me the environment to develop my project, the Director of SSSDIIT-Junagadh college **Shree Rushikesh Swami** who has provide me such a great co-operate as progressive environment and my project evaluator **Mr.Dhaval Trivedi**,the project guide **Mr. Ripal Pandya** to guide me in my project.

No project reaches its destination with individual effort, similarly in my case I have been able to complete my project because of the support I have received from different avenues.

This project would not have seen the light of day without the guidance of my external guide

I extend my heartfelt thanks to him for offering his valued guidance in completing the project and also thankful for his valuable suggestion and efficient supervision in spite of having arduous schedule. The project would have ended in a prenatal stage if not for this perseverance and firm belief in my potential. This project is certainly a success because of his all-around help and concern; any word of thanks would be insufficient for the assistance imparted to me.

Truly every day has been a learning experience for me due to the presence of all the people who have helped me to frame a better life.

Thanks all of you....

Project Profile

Project Name	Airline Reservation System
Developed By	Bhanderi Nitin M.
Class	BCA 5th
Year	2021
Front End	Html,Css,Bootstrap
Back End	MySql,Php
Time Duration	August-2021 To October-2021(2 Months)
Project Evaluator	Mr.Dhaval Trivedi
Guide By	Ripal Pandya
Project Submitted To	SSSDIIT-Junagadh

INTRODUCTION

Airline Reservation system is to provide an option to customers to book the tickets online and to check the confirmation online. This system will help the company to sell the flight tickets online. Unless like in the previous stage people as to walk into travel agency or this company ticket counter to buy the tickets and also to check the flight timings. This problem is overcome introducing this system.

Presently the company has ticket counters in the airport. Where people as to come to book the tickets or to check the flight timings. Also, there are many travel agents take the advance booking. In turn these agents will check out with the main ticket counter officials for the ticket confirmation. This is very lengthy and tedious process.

The proposed system will available online. So, anybody who is interested in the flight timings and ticket booking they check online only.

Objective of the project

1. Online air ticketing saves time by reducing the time involved in the physical transportation of the customer to the reservation counter; online air ticketing process saves time in absolute terms.
2. It enables the customer to purchase tickets from the remote areas, thereby increasing the customer-centricity of the services provided.
3. With a segment of customers opting for the online facilities, the pressure at the reservation counter is substantially reduced.
4. Reduction in the pressure at the reservation counter creates scope to curtail the number of employees at the reservation counters, contributing in cost-cut to the company.
5. With faster, easier and hassle-free services to the customer, the company is poised for a better competitive advantage in face of the oligopolistic structure.
6. Online portal can be used to ascertain any particular facilities that the customer might be looking forward to during the journey.
7. The portal can also be used to inform the prospective customers about the future economy option and other function benefits that the company could have planned; thereby, enabling the customer to plan in advance.
8. With the induction of the cash on delivery system, the customer can easily deliver his air-tickets while being at home.

Requirement Gathering

❖ **Communication Interfaces**

HTTP protocol should be used as an interface of communication between client and server sides.

❖ **Functional Requirements**

Customer should be able to search flights for a specific date for one-way trips.

Customer should be able to search flights for specific dates for round trips.

Customer should be able to search flights for multiple destinations.

Customer should be able to select the names of departure and arrival cities from the list of all flight offered cities.

Customer should be able to specify the number of adults from 1 to 6 while searching for a flight.

Customer should be able to specify the number of children from 0 to 6 while searching for a flight.

Customer should be able to specify the number of infants from 0 to 3 while searching for a flight.

Customer should be able to specify the travel class while searching for a flight.

Customer should be able see all the possible flights based on the information he entered.

Customer should be able to request reservation cancellation.

Customer should be able to see given response to reservation cancellation request.

System should allow a customer to specify both departure and arrival dates for round trips.

System should allow customer to book the ticket to a flight of his choice.

System should demand customer to provide his/her full name to book the ticket.

System should demand customer to enter only characters for full name label.

Provided list of flights should contain information about duration of flight for each flight.

Provided list of flights should contain information about departure and arrival airport names for each flight.

Administrator should be able to add new flights to the system.

Administrator should be able to modify the details of existing flights.

Administrator should be able to remove cancelled flights from the system.

Administrator should be able to see reservation cancellation requests.

Administrator should be able to accept reservation cancellation requests.

Administrator should be able to see details of existing bookings.

❖ **Software System Attributes**

❖ **Usability**

Non-technical background of a user should not be an obstacle to understand and use the system.

❖ **Non-functional Requirements**

❖ **Performance Requirements**

System should be able to handle 1000 transactions per second.

❖ **Reliability Requirements**

System's Service Level Agreement (SLA) level should be of 98%.

Maximum 2 of 1000 online payment transactions through the systems can result in failure.

❖ **Security Requirements**

System should have an Authentication and Authorization System (AAS) for logins.

System should grant administrative privileges only to the one who logins with predefined administrative username and password.

System should allow administrator to change his/her system-generated password as he/she wishes.

System should allow administrator to login with customized password.

System should guarantee the security of communication channel.

Customized password should be at least 8 characters.

Customized password should contain both letters and numbers.

Maintainability Requirements User should be displayed acceptance message within 5 seconds, when he/she submits entered data to the system.

Warning messages about entrance data out of defined standards must remain on the screen for 3 seconds.

❖ **Portability Requirements**

System should be manageable in web-browsers of Internet Explorer, Google Chrome, Mozilla Firefox, Opera and Safari.

❖ **Safety Requirements**

System should include restore and recover functions in order to prevent data loss.

System should assure data integrity.

❖ **Other Requirements**

System should display a warning message if the customer input for full name label is out of defined standard.

System should display a warning message if the customer input for travel document number is out of defined standard.

System should display a warning message if the customer wants to book flights for more than 6 people.

System should display a warning message if the administrator tries to customize his/her password out of defined standards.

❖ **Software Requirements**

Windows Operating System

Mysql

❖ **System Requirements**

Minimum: Pentium 166 (32 MB RAM)

Recommended: Pentium 200 (64 MB RAM)

Disk Space: 101 MB

❖ **Display Properties**

Minimum: 800 x 600 (16 Bit)

Recommended: 800 x 600 (24 Bit)

Feasibility Study

❖ **Technical Feasibility**

The current system has Personal Computers. All the works are done on Word Processor and spreadsheets. The company already possesses the required software.

In the current working system, it requires time to produce the reports. The response time is high for processing queries.

❖ **The Proposed System:**

In the proposed system, there will be a standalone Personal Computer with the required application. And with minor modification in software it can also run in network. There is no significant difference between the current system and the proposed design of the system. The System will generate receipts; produce the required reports. The system will also have feature to calculate profit and loss account.

❖ **Economical Feasibility**

The company already possesses the required hardware and software. There is no investment in hardware and software.

The benefits of installing the application lie in the speedy processing of data, faster retrieval of information and increasing volume of data, and all these with greater accuracy and consistency.

To sum up, the benefits are great and cost is minimal. Therefore, the project is economically feasible.

❖ **Operational Feasibility**

The system is expected to work smoothly when developed and installed. There has been participation of management and the computer operators in planning and development of the system. There will be a slight change in the format of the reports to which management agreed. There is no disturbance in organizational structure of the company. The new application for the system will have Graphical User Interfaces (GUI). The applications with GUI are very easy to handle and operate. The company has to train their staff members which can easily done in one or two days. They need to be instructed regarding using of the application software.

Data Dictionary

Dictionary the logical characteristic of current system data stores including Name,Address flight code,Source,Destination airline code,Flight code etc. Identifies process where the data are used and where immediate access to information required. Server as the basis for identifying database requirements during system design

use of data dictionary

- To manage the details in large system
- To communicates a common meaning for all system elements
- To documents the features of the system
- To facilities analysis of the details in order to characteristic and determine where system changes should be made
- To locate errors and omissions in the system

Data Flow Diagram

Definition:

A data flow diagram is a graphical technique that depicts information flow and the transforms that applied as data move from input to output. The Data flow diagram used to represent a system or software at any level of abstraction. In fact DFDs may be portioned into levels.

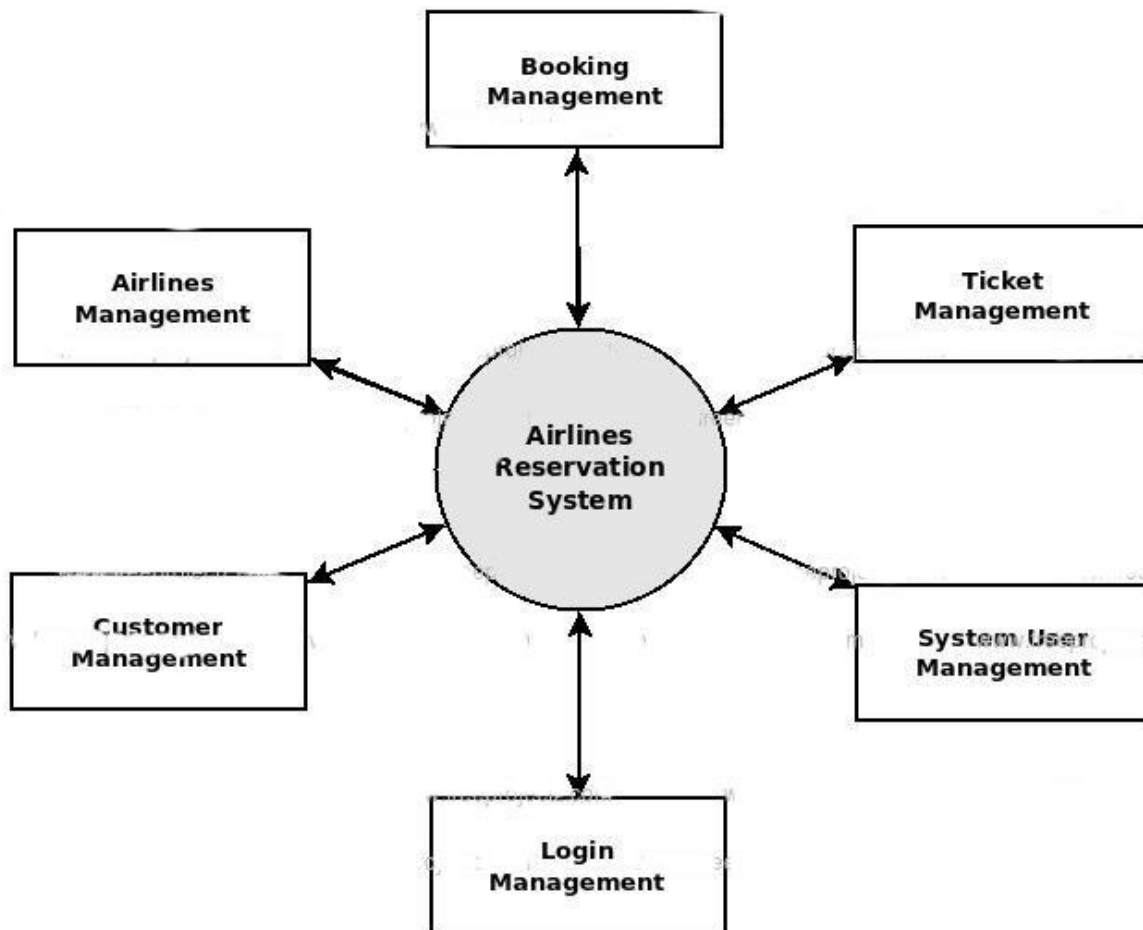

A level of DFD, also called a context model, represents the entire software elements as a single bubble with input and output by arrow. A level of DFD is portioned into several bubbles with inter connecting arrows. Each of the process represented at level one is sub function of the over all depicted in the context model.

The DFD Notations:

Stored Information that is used by the s/w

Waterflow Model

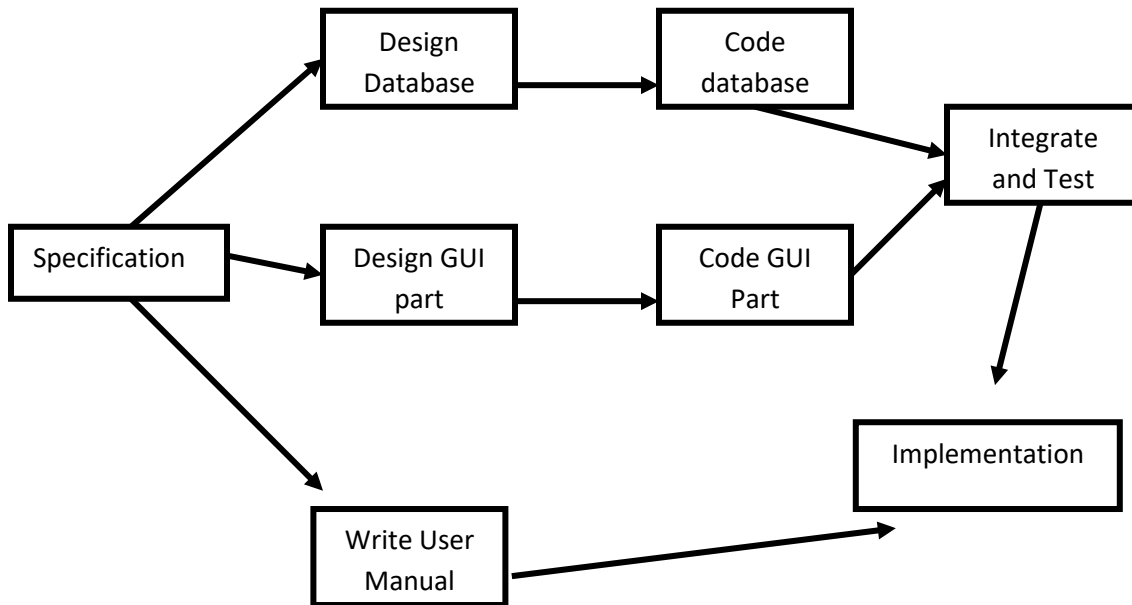

Gantt Chart

It is also known as Bar chart is used exclusively for scheduling purpose. It is a project controlling technique. It is used for scheduling. Budgeting and resourcing planning. A Gantt is a bar chart with each bar representing activity. The bars are drawn against a time line. The length of time planned for the activity. The Gantt chart in the figure shows the Gray parts is slack time that is the latest by which a task has been finished.

Pert Chart

PERT chart is organized for events, activities or tasks. It is a scheduling device that shows graphically the order of the tasks to be performed. It enables the calculation of the critical path. The time and cost associated along a path is calculated and the path requires the greatest amount of elapsed time in critical path.

Test Case

Check whether the page is possible to login without providing user any details

Check and try to log in to the page with three characteristics user name.

Check and log in the page with a valid username

Check and log in the page with correct username and invalid password

Check and log in the page with a valid username and valid password

Check whether the password is encrypted form while entering the same

Check whether the application is accepting the date in DD/MM/YY format

Check whether the application is recognizing the time in MM/DD/YY format

Check the date by entering the same in MM/DD/YY but execute the test by providing the single-digit value for date and month

Check the website whether there is any functionality for adding new flights

Check after adding a new plane in the system is the trip have all the details like flight name, code of the flight, from and to destinations, frequency, timings, and capacity of the plane.

Check you can search the newly added flight by entering the name, from to airport details or by entering the flight code

Check whether the drop-down list box are listings the name of the boarding places

Check whether the drop-down list box is listing the name of the destination places to select the location.

Check the application whether it is showing the availability of the flights with date and timings of the departure

Check is the search result has the details like and availability of seats

Check if user click on the flight name is it giving all the details

Check if the user is getting the real-time results of the flight like availability of seats

Check when the user click on the book button then is the graphical user interface for the seats are displaying

Check if the pricing of different types of seats are showing to the user

Check if the user can select one or more seats.

Check whether the user can choose to pre-book seat or not, the vendor used to try to choose a booked seat that time it should display and a warning message

Check after selecting one or multiple seats, when the user clicks the process button that time it redirects the user to the passenger details page where the user needs to fill all the passenger details to complete the booking process.

Check a user can download that ticket the ticket is visible after complete the booking process

Check the seat status after a user is or complete the booking process, the status should be changed from available to book

Check after complete the booking process is the user is getting an email confirmation to the email ID provided in the passenger details page

Check how many seats a user can book at a time, If he's tried to book more than the allowed seats then an error message should be display

Check whether all the different payment options are working properly

Check while booking seats. The additional information should also be displayed like luggage comma extra legroom, foods, etc . if the user selects any extra option, then the extra charges also need to be added in the actual price of the seat.

Check a user can cancel a book ticket after cancelling the ticket the money should be refunded to the same account which is used while booking a ticket

Check if a seat is cancelled then the status of the seat should change from booked to available

Check if the help option is provided on the website or portal, also verify if the help section contains all the required information

Check-in the contact up page have an option to contact Airlines for any assistance.

Check if there any option for web check-in before the flight

Check if there any functionality to inform a user if the flight get delay

Check whether the cursor is moving to the name of the passenger field for entering the passenger name who is going to travel

Check the application is allowed to selecting the class of travel by clicking the available options like first, second and business class

Check whether the application is showing the details of the passenger order once it has been placed.

Future scope of the project / Limitation

Technical Feasibility involves financial considerations to accommodate technical enhancement. If the budget is a serious constraint then the project is judged 'not feasible'

Here the cost incurred by searching an appropriate s/w which may handle by some few people and hidden to others, but it reduces the searching time, so it technically fit.

The module reduce the work load of different end user , and gives a clear picture about the s/w required so the user use this module , hence this system is operationally feasible .

As this page is technically, economically sequiritically and operationally feasible, so this system is judged feasible.

This roject is not responsive so mobile user can not access it.
